

Fawn Tall Fescue

This cool/ transition zone bunch grass, perennial, has a root system with over a 36" depth. This makes this species better for tolerating heat and dry conditions than other shallow rooted cool season grasses. Fawn Tall fescue is well suited for a wide range of soil conditions, ranging from high to low soil pH, soil types and low fertility soils.

Fawn Tall Fescue is an excellent forage grass that has good palatability when the plants are young, as stems and leaves become coarse with age.

Recommended seeding rates:

350-400 pounds per acre when planted as a lawn grass

70-100 pounds per acre for forage when planted as a mix
