

# ACTION

KENTUCKY BLUEGRASS

- ✓ Great spring green up
- ✓ Reduced top growth
- ✓ Good drought recovery and wear tolerance

New Jersey Trial Location, 3rd  
Week of May, Non-Irrigated,  
Natural Rain Water Only

## Time for Action!

**Action** Kentucky bluegrass (*Poa pratensis*) features a deep, aggressive rhizome system for improved drought recovery and wear tolerance. Very quick to germinate and establish, **Action** is an ideal component for mixes designed to reduce soil erosion from wind and rain. **Action** shows reduced top-growth when compared to older varieties and has a fine leaf texture with attractive spring-green color.

Under environmental stresses, **Action** compares favorably to Texas hybrid bluegrasses.

Low to Moderate Maintenance: With a low nitrogen requirement and quick establishment, **Action** is ideal for cool season mixes where ground coverage is the primary concern and maintenance budgets are low. Ideal for roadsides, parks, cemeteries, roadside berms, levees, and all low to moderately maintained turf areas.

Fast Establishment: Quick germination and establishment are very important keys when competing with other aggressive mix components such as perennial ryegrass, tall fescue, and fine fescues. Whereas many bluegrass components are often 'lost' in the mix due to slow establishment, **Action's** fast growth enables it to be a functioning, active mix component for years to come.

Early Spring Green-Up: **Action's** early spring green-up is well suited for areas with early spring use and for competing with spring weeds and other early spring cool-season grasses such as perennial ryegrass.

Drought Recovery: Deep, thick rhizomes are a very important key to bluegrass survival during periods of drought and heat stress. Once established, **Action's** system of deep rhizomes provides a key to survival, helping to insure stand survival and safe, playable turf.

Mix Recommendations: **Action** is best mixed with perennial ryegrass and fine fescue at approximately 30-40% by weight. When mixed with tall fescue, 10-20%.

Recommended Seeding Rates:

New establishment: 2-3 lb./1,000ft<sup>2</sup> (or 10-15g/M<sup>2</sup>)

Overseeding into existing turf: 3-4 lb./1,000ft<sup>2</sup>  
(or 15-20g/M<sup>2</sup>)
